## WHAT IS CLAIMED IS:

- 1. A transporter to facilitate the movement of a person having impaired or no self-locomotion from a location at a first elevation and location to a higher or lower elevation at a laterally spaced-apart location, comprising:
- a base having a horizontal orientation and a vertical axis;

wheels enabling said base to be moved in said horizontal orientation;

- a platform having a flat upper surface normal to said axis;
- a jack mounted to said base below said platform, extending between them so as to enable and power the elevation of the platform relative to the base;
  - a power source to activate said jack;
- a control to permit actuation of said jack by said power source;

said platform being substantially planar and smooth whereby to facilitate the lateral sliding movement of a person resting on it.

2. A transporter according to claim 1 in which said jack includes a threaded screw having locking characteristics whereby to prevent lowering of the platform except when the screw is

- 3. A transporter according to claim 1 in which said base includes an axially-extending guide, and said platform includes a downwardly- extending peripheral skirt, whereby to shroud said jack from outside contact.
- 4. A transporter according to claim 1 in which said platform includes a removably attached stabilizer to frustrate lateral movement of a person from said platform in at least one direction.
- 5. A transporter according to claim 4 in which said stabilizer comprises a post, and a socket in said platform to receive said post.
- 6. A transporter according to claim 1 in which said power source is a bi-directionally driven electric motor.
- 7. A transporter according to claim 1 in which there is a plurality of said wheels at least some of which are steerable and lockable.

- 8. A transporter according to claim 2 in which said base includes an axially-extending guide, and said platform includes a downwardly- extending peripheral skirt, whereby to shroud said jack from outside contact.
- 9. A transporter according to claim 8 in which said
  platform includes a removably attached stabilizer to frustrate
  lateral movement of a person from said platform in at least one
  direction.
  - 10. A transporter according to claim 9 in which said power source is a bi-directionally driven electric motor.
  - 11. A transporter according to claim 10 in which there is a plurality of said wheels at least some of which are steerable and lockable.
  - 12. A transporter according to claim 1 in which a pair of lips depend from opposite edges of said platform to provide a hand hold for a transported person.
